^a The estimated log marginal likelihood using path sampling (PS) and stepping stone sampling (SS), lower absolute values of marginal likelihood indicate a better fit to the data.

^b The likelihood using Akaike's Information Criterion for MCMC samples (AICM), lower values of marginal likelihood indicate a better fit to the data.

^c The estimated harmonic marginal likelihood of posterior (HME), lower absolute values of marginal likelihood indicate a better fit to the data.

For predictors, their correlations to the AIV diffusion in two region types (TR, ED) were summarized and the columns represented six internal segments.

a: IP is the abbreviation of the inclusion probabilities, ranging between 0 to 1, representing the less precise values by showing only 2 decimal places.

b: the Bayes Factor estimates for the inclusion probabilities with BF>3 indicating a statistical significant (in bold).

c: the correlation Coefficient with mean and 95% HPD interval. The mean and intervals above 0 indicates a positive correlation (in red), while the value below 0 indicates a negative correlation (in blue).

Table S10: Original predictor data per province

Predictor data are referenced from the China statistical year book 2013 and the China agriculture yearbook 2012. The table is separated into three parts for display. The predictor name keys (and units) are listed at the end.
